

**75066****Glassy Brescia****0.98 g, 0.5 x 1.2 x 1cm****INTRODUCTION**

75066 was described as a dark gray, intergranular (friable) breccia, with penetrative fracturing (Apollo 17 Lunar Sample Information Catalog, 1373). It has an irregular shape and is a mixture of dirt and glass (see Fig. I of 75065). Welded dust is present on all sides. No zap pits are present, but 10% of the surface area is covered with irregular cavities, which are neither vugs nor vesicles.
