## INTRODUCTION

Quantitative electron microprobe data of Apollo 15 non-mare rake samples are presented here. Almost all the data have not been previously published. Some of the interpretation of the data for non-mare rocks and the conclusions drawn are presented in Dowty et al. (1972a and b) and a more complete report is in preparation. Bulk analyses and descriptions of these rocks are given in the Apollo 15 rake sample catalogue by Dowty et al. (1973a). Bulk analyses of lithic fragments in the non-mare rocks (expressed in oxide weight-percent) and the corresponding CIPW molecular norms are given in this publication. The mineralogy of the rocks and lithic fragments are also given; structural formulae for complete analyses and molecular end-members for all mineral analyses are included. The mineral analyses include pyroxene, olivine, plagioclase, barian K-feldspar, spinel and ilmenite, cobaltian metallic nickel-iron as well as  $\text{SiO}_2\text{-K}_2\text{O}$ -rich residual glass. Spinel and ilmenite data from some of these samples are presented in Nehru et al. (1973). Data on other minor mineral phases, such as zirkelite and armalcolite, occurring in these rocks will be presented elsewhere.

The standards used for all analyses of lithic fragments are the same as those described in Dowty et al. (1973a). The standards used for mineral analyses are the same as those given in Dowty et al. (1973b). The grain numbers are recorded at the top of each column of analysis and correspond to the numbers marked on photo mosaics on file in the Institute of Meteoritics. Complete mineral analyses were corrected for differential matrix effects by the procedure of Bence and Albee (1968).

Electron microprobe analyses (oxide weight percent) of glasses in loose fines and microbreccia samples and their CIPW molecular norms are presented next. The interpretation of these data and the conclusions drawn are presented in Bunch et al. (1972) and a more complete report is in preparation. The glasses are listed in increasing order of FeO within each sample and classified according to their bulk composition, shape and color. The following abbreviations are used. Note that these abbreviations are used only for convenience and to save space. The compositional groups are defined in Bunch et al. (1972; in preparation).

<u>Color</u>		<u>Compositional Groups</u>
C	Clear (grayish-white)	FP Feldspathic peridotite (green glass)
P	Pink (pink-lavender)	IOB Ilmenite olivine basalt
G	Green	PIC Picrite (Ilmenite-bearing)
Y	Yellow	BAS Basalt
O	Orange (orange-brown-amber)	ANT Anorthositic-noritic-troctolitic suite
OP	Opaque	HAB High-alumina basalt (Low alkali)
<u>Shape</u>		AHAB Alkali-high-alumina basalt (KREEP)
F	Fragment	MISC Miscellaneous
S	Spherule	

The numbers at the top of each column of analyses correspond to the numbers marked on photo mosaics on file in the Institute of Meteoritics. The standards used for glass analyses are as follows: pyroxene  $\text{A}2\text{O}_9\text{-SiO}_2\text{-Al}_2\text{O}_3$  and  $\text{MnO}$ ; pyroxene  $\text{A}2\text{O}_7\text{-Cr}_2\text{O}_3$  and  $\text{Na}_2\text{O}$ ; synthetic glass  $\text{Cl}3\text{Sb}3\text{-TiO}_2\text{-FeO}\text{-MgO}\text{-CaO}\text{-K}_2\text{O}\text{-P}_2\text{O}_5$  and  $\text{ZrO}_2$ .

Electron microprobe data on bulk, mineral, and matrix glass from chondrules are presented last. Standards used are the same as those for glasses. The interpretation of these results and their conclusions are presented in Bunch et al. (1972; in preparation).

**Acknowledgments:** We thank J. Erlichman for some electron microprobe analyses; W. L. Quaide for some electron microprobe data on green glasses in loose fines; G. Moreland of Smithsonian Institution for preparing excellent polished thin sections for electron microprobe analysis; R. Cox, J. Ethridge, R. D. Fisher, R. Geitgey, G. Honea, J. Hultzen, D. Lange, and D. Lewis for help in data reduction. This work is supported in part by NASA Grant No. 32-004-063. (Klaus Keil, Principal Investigator).
